

ClimateCoating Nature ABC

Reflective membrane technology

ClimateCoating Nature is a highly effective, water-based exterior finish for non-dimensionally stable wooden components. It has a significant, positive impact on key factors in our indoor climate, such as temperature and humidity, as well as on maintenance intervals. GREENGUARD GOLD-certified Nature is ultra-elastic and available in all colors. Nature has a very matte appearance.

Temperature regulating

Nature ensures that the building doesn't overheat. The sunlight reflection in a white version is 91%, and in most dark colors, it's still over 50%. This significantly reduces energy costs for air conditioning, since what doesn't heat up doesn't need to be cooled.

Moisture regulating

Using the principle of capillary dehumidification, the Nature (reflective) membrane ensures rapid and active dehumidification of the facade, restoring and maintaining its original insulation value. This process takes into account the necessary moisture content of wood. In the event of rain, Nature seals itself off and prevents moisture from entering the building; water simply drains off the facade, taking any contaminants with it.

To prevent dust adhesion with ClimateCoating GlossPlus, ClimateCoating GlossPlus can be applied over the (dry) Nature.

Dry facades deprive mold, algae, and mosses of a breeding ground, making it difficult or impossible for them to develop on the facade.

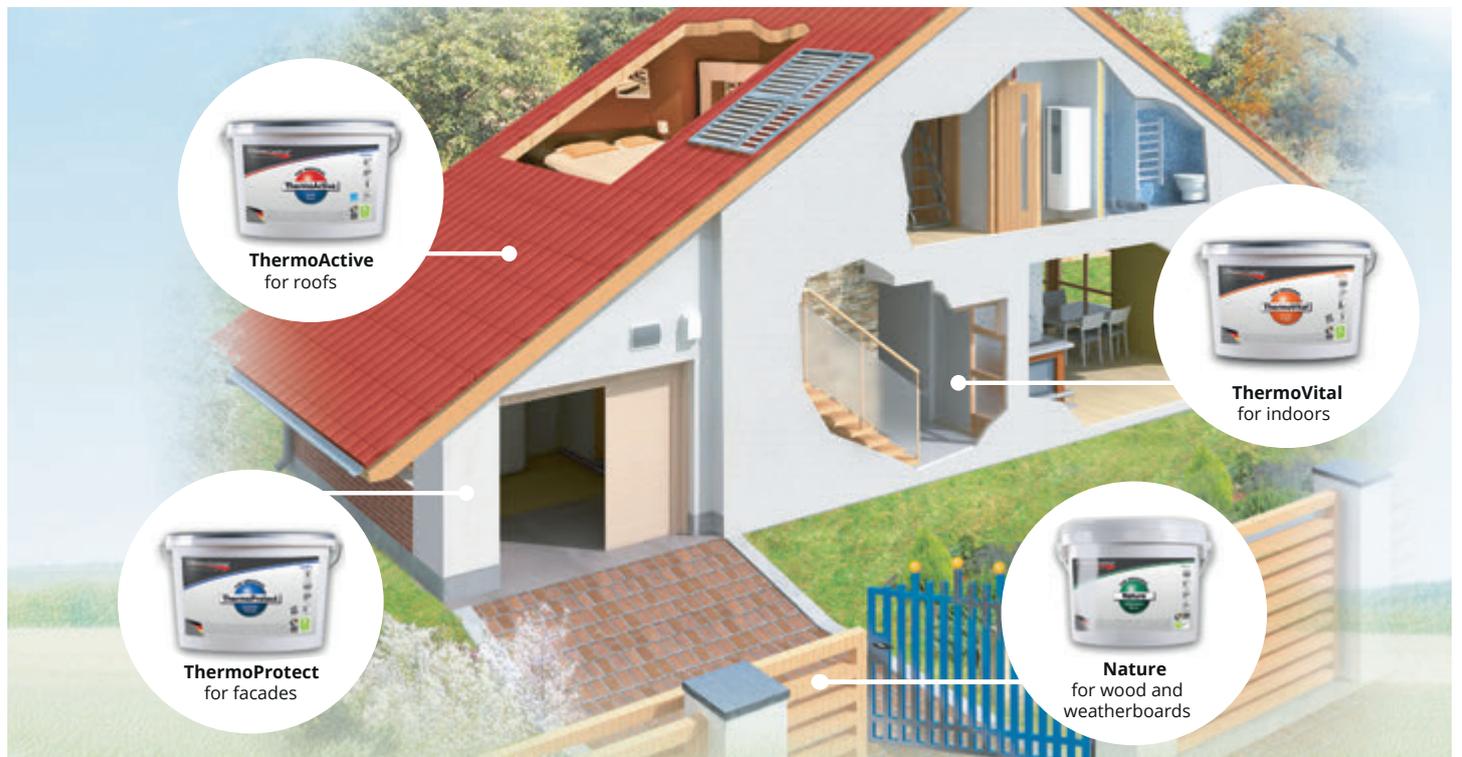

Less maintenance, longer lifespan

The ceramic components in Nature are UV blockers. In addition, the pigment pastes used are inorganic and highly UV-resistant. Together with the pure acrylic, these three components are essential for a long lifespan: minimal to no cracking, powdering and/or discoloration.

The application areas of ClimateCoating

The range is compact and yet complete.

Easy to apply

Nature is easy to use. The product's texture is so fine that it looks like any other paint. Nature can be applied with a roller or, for professionals, with a paint sprayer (airless or airmix); thanks to the low application pressure, this creates virtually no overspray. NaturePrimer is recommended first for bare wood.

Nature is suitable for all wooden surfaces. It covers excellently and dries quickly.

The theoretical consumption of Nature is 0.25 liters per m².

To maximize the benefits of this product, this quantity should be used (two rolls or sprayed at once).
